10 Ways to Help Prevent Dementia

Dementia is a loss of brain function that affects daily life, with Alzheimer's being the most common type. By 2060, nearly 14 million Americans over 65 may be affected. The good news? Many risk factors are modifiable. Research shows up to half of dementia cases could be delayed or prevented through healthy lifestyle changes.

- **Keep Blood Pressure Steady** Healthy blood pressure helps protect memory and cognition.
- **Move Your Body** Regular exercise keeps your brain sharp and strong.
- Maintain a Healthy Weight Managing weight in midlife supports long-term brain health.
- **Balance Blood Sugar** Stable blood sugar helps prevent cognitive decline.
- **Quit Smoking & Limit Alcohol** Less smoking and drinking means better brain protection.

Stay Connected & Curious Social time and learning new things keep your mind active.
